

Instructions to run code:

1. Place code and assignment2.pcap file in same directory/folder
2. Run the python file in terminal or shell

Python should automatically detect the pcap file if it is the same directory as the program file and open it. If it does not, it may require adding the specific directories to the name of the file in the python program in `f = open('assignment2.pcap', 'rb')`

If the pcap file is read properly, the generated output should (hopefully) be organized and labelled enough to identify the solutions to the homework problems.

I used vscode to write the program and vscode's terminal to run the program.
